TEK-TOOLS SOFTWARE RELEASES BACKUP POLICY AUDITOR

Never let a missed backup go unnoticed

DALLAS, Texas – June 16, 2006 – Tek-Tools Software, the leading independent provider of resource management software solutions, announces the release of the first of its Backup Compliance Modules. The Policy Auditor for VERITAS NetBackup automates the management and tracking of scheduled backup jobs and provides a real means to audit backup policies and schedules. NetBackup users can now track missed client schedules and compare what was supposed to be backed-up against what was actually backed-up.

Profiler's Backup Policy Auditor retains historical data for compliance and trending purposes. Establishing policies, enabling processes for compliance, and tracking missed backups are all done from Profiler's easy-to-use and intuitive web-based console.

"From a compliance perspective, the ability to have a predictable process in place to audit what jobs were scheduled to run but, in fact, never ran is just as important as understanding what jobs failed or succeeded. The creation of the Backup Policy Auditor is a direct result of feedback from our customers," stated Curt Simmons, Vice President of Sales. "Ultimately, if you truly listen to what your customer base is telling you they need, you end up delivering practical solutions that deliver real value."

"Any comprehensive disaster recovery and business continuity plan is incomplete unless you can validate all three outcomes of a backup job: failed, succeeded, or missed. NetBackup users now have a way to eliminate, what was up to this point, a black hole," concluded Simmons.

"Customers continue to struggle with their backup processes, as organizations generate more and more data to be protected," said Doug Chandler, IDC Program Director, Storage Software. "Tek-Tools' Backup Policy Auditor is designed to provide more accurate tracking of which scheduled backup jobs actually ran – a key component in overall backup management."

Tek-Tools is developing Policy Auditor modules for all supported backup applications to be released later this year.

Profiler is a modular, real-time and historical resource monitoring and reporting framework for servers, storage, connectivity, applications, and backup. Tek-Tools' award winning design offers a consolidated view of heterogeneous environments, relating storage and backup resources to the applications they support. Profiler allows end users to easily collect data, monitor, and report on critical infrastructures that both automate and simplify the management of diverse environments while also reducing operational overhead and reclaiming valuable administrative cycles via automation. The Profiler Suite consists of: ServerProfiler, StorageProfiler, BackupProfiler, and AppProfiler.

About Tek-Tools

Tek-Tools Software, Inc. is the recognized leader in the storage resource management space. Tek-Tools' Profiler Suite is a high-performance, modular, Web-based, real-time and historical resource reporting application targeting DAS, NAS, SAN, database, and backup pain points in customer environments. Tek-Tools' headquarters are located at

4020 McEwen Dr., Suite 105, in Dallas, Texas 75244, (972) 980-2890, and on the Web at www.tek-tools.com.
